

DP-603: Implement Real-Time Intelligence with Microsoft Fabric

Exercise 4 : Get started with Real-Time Dashboards in Microsoft Fabric

- Create a workspace
- Create an eventhouse
- Create an eventstream
- Create a real-time dashboard
- Create a base query
- Add a parameter
- Add a page
- Configure auto refresh
- Save and share the dashboard

Eventhouse

This destination lets you ingest your real-time event data into an eventhouse, where you can use the powerful Kusto Query Language (KQL) to query and analyze the data.

Add a page

The screenshot displays the Microsoft Fabric Power BI interface. On the left is a navigation pane with icons for Home, Copilot, Create, OneLake catalog, Apps, Scorecards, Browse, Workspaces, My workspace, and a specific dashboard named 'bikes-dashboards'. The main area is titled 'Home' and 'Manage'. Below the navigation pane, there's a 'Pages' section with 'Page 1' and 'Page 2' (selected). The main content area shows a table titled 'Untitled' with 19 rows, updated 'As of less than a minute ago'. The table has two columns: 'Neighbourhood' and 'latest_observation'. The data shows bike sightings in various London neighborhoods like Mile End, Battersea, Olympia, etc., with timestamps. At the bottom left of the main area, there's a '+ Add page' button.

Neighbourhood	latest_observation

Refresh settings

Live refresh (Recommended)

Dashboards visuals will be refreshed automatically once newly ingested data is added into the data source

Settings

Refresh rate limit

30 minutes

Sets a floor refresh rate to avoid refreshing too frequently even if the data source does

Fixed rate for non-supporting visuals

Every 5 minutes

If new data ingestion cannot be detected, visuals will refresh based on this rate

Manual refresh only

Dashboards visuals will remain static until viewers manually refresh them
